# C++ Development

Piptor F

To build a C++ application for the Raspberry Pi, you have to follow three main steps: 1. Build a cross-compilation toolchain, 2. Cross-compile the libraries you want to use, 3. Build your actual C++ application.

These pages explain how to build a cross-compilation toolchain using Crosstool-NG, and then uses it to compile the following libraries:

- **Zlib**: compression library (OpenSSL and Python dependency)
- OpenSSL: cryptography library (Python dependency)
- FFI: foreign function interface (Python dependency, used to call C functions using ctypes)
- Bzip2: compression library (Python dependency)
- GNU ncurses: library for text-based user interfaces (Python dependency, used for the console)
- GNU readline: library for line-editing and history (Python dependency, used for the console)
- GNU dbm: library for key-value data (Python dependency)
- **SQLite**: library for embedded databases (Python dependency)
- **UUID**: library for unique identifiers (Python dependency)
- Python 3.8.1: Python interpreter and libraries
- ZBar: Bar and QR code decoding library
- Raspberry Pi Userland: VideoCore GPU drivers
- VPX: VP8/VP9 codec SDK
- x264: H.264/MPEG-4 AVC encoder
- Xvid: MPEG-4 video codec
- FFmpeg: library to record, convert and stream audio and video
- OpenBLAS: linear algebra library (NumPy dependency)
- NumPy: multi-dimensional array container for Python (OpenCV dependency)
- SciPy: Python module for mathematics, science, and engineering
- OpenCV 4.2.0: computer vision library and Python module
- GDB Server: on-target remote debugger
- GCC 9.2.0: C, C++ and Fortran compilers
- GNU Make: build automation tool
- CMake: build system
- Distce: distributed compiler wrapper (uses your computer to speed up compilation on the RPi)
- CCache: compiler cache
- **cURL**: tool and library for transferring data over the network (Git dependency)
- Git: version control system

The fourth page presents a small "hello world" example project that uses CMake and Google Test.

Finally, there's a page on remote on-target debugging using GDB and Visual Studio Code.

## **Building the Cross-Compilation Toolchain**

To compile software for the Raspberry Pi, you need a cross-compilation toolchain. This page contains instructions for how to build one.

## Cross-Compiling the Dependencies

Using the cross-compilation toolchain to build the libraries you need for your project, as well as their dependencies.

## Setting up Visual Studio Code for C++ Development

Installing and configuring the right extensions for easy C++ development in VSCode.

#### Cross-Compiling the C++ Example Project

Using the cross-compilation toolchain to build your own C++ project.
